Chapter 1

Crypto Release Notes

The Crypto Application provides functions for computation of message digests, and encryption and decryption functions.

1.1 Crypto Release Notes

This document describes the changes made to the Crypto application.

1.1.1 Crypto 1.1.2

Reported Fixed Bugs and Malfunctions

- In the manual page `crypto(3)` the function names `md5_finish` and `sha_finish` have been changed to `md5_final` and `sha_final` to correctly document the implementation. Own Id: OTP-3409

1.1.2 Crypto 1.1.1

Code replacement in runtime is supported. Upgrade can be done from from version 1.1 and downgrade to version 1.1.

Improvements and New Features

- The driver part of the Crypto application has been updated to use the `erl_driver` header file. Version 1.1.1 requires emulator version 4.9.1 or later.

1.1.3 Crypto 1.1

Reported Fixed Bugs and Malfunctions

- On Windows the `crypto_drv` was incorrectly linked to static run-time libraries instead of dynamic ones. Own Id: OTP-3240

1.1.4 Crypto 1.0

New application.

Crypto Reference Manual

Short Summaries

- Application crypto [page 5] – The Crypto Application
- Erlang Module crypto [page 6] – Crypto Functions

crypto

No functions are exported.

crypto

The following functions are exported:

- `start()` -> `ok`
[page 6] Start the crypto server.
- `stop()` -> `ok`
[page 6] Stop the crypto server.
- `info()` -> `[atom()]`
[page 6] Provide a list of available crypto functions.
- `md5(Data)` -> `Digest`
[page 6] Compute an MD5 message digest from Data
- `md5_init()` -> `Context`
[page 6] Creates an MD5 context
- `md5_update(Context, Data)` -> `NewContext`
[page 7] Update an MD5 Context with Data, and return a NewContext
- `md5_final(Context)` -> `Digest`
[page 7] Finish the update of an MD5 Context and return the computed MD5 message digest
- `sha(Data)` -> `Digest`
[page 7] Compute an SHA message digest from Data
- `sha_init()` -> `Context`
[page 7] Create an SHA context
- `sha_update(Context, Data)` -> `NewContext`
[page 7] Update an SHA context
- `sha_final(Context)` -> `Digest`
[page 7] Finish the update of an SHA context

- `md5_mac(Key, Data) -> Mac`
[page 7] Compute an MD5 MAC message authentication code
- `md5_mac_96(Key, Data) -> Mac`
[page 8] Compute an MD5 MAC message authentication code
- `sha_mac(Key, Data) -> Mac`
[page 8] Compute an MD5 MAC message authentication code
- `sha_mac_96(Key, Data) -> Mac`
[page 8] Compute an MD5 MAC message authentication code
- `des_cbc_encrypt(Key, IVec, Text) -> Cipher`
[page 8] Encrypt Text according to DES in CBC mode
- `des_cbc_decrypt(Key, IVec, Cipher) -> Text`
[page 8] Decrypt Cipher according to DES in CBC mode

crypto

Application

This chapter describes the application Crypto in OTP, which provides message digests MD5 and SHA, and CBC-DES encryption and decryption.

The purpose of this application is to provide message digest and DES encryption for SMNPv3.

Configuration

The following environment configuration parameters are defined for the Crypto application. Refer to `application(3)` for more information about configuration parameters.

`debug = true | false <optional>` Causes debug information to be written to standard error or standard output. Default is `false`.

SEE ALSO

crypto

Erlang Module

This module provides a set of cryptographic functions.

References:

- md5: The MD5 Message Digest Algorithm (RFC 1321)
- sha: Secure Hash Standard (FIPS 180-1)
- hmac: Keyed-Hashing for Message Authentication (RFC 2104)
- des: Data Encryption Standard (FIPS 46-2)
- ecb, cbc, cfb, ofb: DES modes of operation (FIPS 81).

Types

```
byte() = 0 ... 255  
ioelem() = byte() | binary() | iolist()  
iolist() = [ioelem()]
```

Exports

`start() -> ok`

Starts the crypto server.

`stop() -> ok`

Stops the crypto server.

`info() -> [atom()]`

Stops the crypto server.

`md5(Data) -> Digest`

Types:

- Data = iolist() | binary()
- Digest = binary()

Computes an MD5 message digest from Data, where the length of the digest is 128 bits (16 bytes).

`md5_init() -> Context`

Types:

- Context = binary()

Creates an MD5 context, to be used in subsequent calls to md5_update/2.

md5_update(Context, Data) -> NewContext

Types:

- Data = iolist() | binary()
- Context = NewContext = binary()

Updates an MD5 Context with Data, and returns a NewContext.

md5_final(Context) -> Digest

Types:

- Context = Digest = binary()

Finishes the update of an MD5 Context and returns the computed MD5 message digest.

sha(Data) -> Digest

Types:

- Data = iolist() | binary()
- Digest = binary()

Computes an SHA message digest from Data, where the length of the digest is 160 bits (20 bytes).

sha_init() -> Context

Types:

- Context = binary()

Creates an SHA context, to be used in subsequent calls to sha_update/2.

sha_update(Context, Data) -> NewContext

Types:

- Data = iolist() | binary()
- Context = NewContext = binary()

Updates an SHA Context with Data, and returns a NewContext.

sha_final(Context) -> Digest

Types:

- Context = Digest = binary()

Finishes the update of an SHA Context and returns the computed SHA message digest.

md5_mac(Key, Data) -> Mac

Types:

- Key = Data = iolist() | binary()
- Mac = binary()

Computes an MD5 MAC message authentication code from `Key` and `Data`, where the length of the Mac is 128 bits (16 bytes).

`md5_mac(Key, Data) -> Mac`

Types:

- `Key = Data = iolist() | binary()`
- `Mac = binary()`

Computes an MD5 MAC message authentication code from `Key` and `Data`, where the length of the Mac is 96 bits (12 bytes).

`sha_mac(Key, Data) -> Mac`

Types:

- `Key = Data = iolist() | binary()`
- `Mac = binary()`

Computes an SHA MAC message authentication code from `Key` and `Data`, where the length of the Mac is 160 bits (20 bytes).

`sha_mac_96(Key, Data) -> Mac`

Types:

- `Key = Data = iolist() | binary()`
- `Mac = binary()`

Computes an SHA MAC message authentication code from `Key` and `Data`, where the length of the Mac is 96 bits (12 bytes).

`des_cbc_encrypt(Key, IVec, Text) -> Cipher`

Types:

- `Key = Text = iolist() | binary()`
- `IVec = Cipher = binary()`

Encrypts `Text` according to DES in CBC mode. `Text` must be a multiple of 64 bits (8 bytes). `Key` is the DES key, and `IVec` is an arbitrary initializing vector. The lengths of `Key` and `IVec` must be 64 bits (8 bytes).

`des_cbc_decrypt(Key, IVec, Cipher) -> Text`

Types:

- `Key = Cipher = iolist() | binary()`
- `IVec = Text = binary()`

Decrypts `Cipher` according to DES in CBC mode. `Key` is the DES key, and `IVec` is an arbitrary initializing vector. `Key` and `IVec` must have the same values as those used when encrypting. `Cipher` must be a multiple of 64 bits (8 bytes). The lengths of `Key` and `IVec` must be 64 bits (8 bytes).

DES in CBC mode

The Data Encryption Standard (DES) defines an algorithm for encrypting and decrypting an 8 byte quantity using an 8 byte key (actually only 56 bits of the key is used).

When it comes to encrypting and decrypting blocks that are multiples of 8 bytes various modes are defined (FIPS 81). One of those modes is the Cipher Block Chaining (CBC) mode, where the encryption of an 8 byte segment depend not only of the contents of the segment itself, but also on the result of encrypting the previous segment: the encryption of the previous segment becomes the initializing vector of the encryption of the current segment.

Thus the encryption of every segment depends on the encryption key (which is secret) and the encryption of the previous segment, except the first segment which has to be provided with a first initializing vector. That vector could be chosen at random, or be counter of some kind. It does not have to be secret.

The following example is drawn from the FIPS 81 standard, where both the plain text and the resulting cipher text is settled. We use the Erlang bitsyntax to define binary literals. The following Erlang code fragment returns 'true'.

```
Key = <<16#01,16#23,16#45,16#67,16#89,16#ab,16#cd,16#ef>>,
IVec = <<16#12,16#34,16#56,16#78,16#90,16#ab,16#cd,16#ef>>,
P = "Now is the time for all ",
C = crypto:des_cbc_encrypt(K, I, P),
C == <<16#e5,16#c7,16#cd,16#de,16#87,16#2b,16#f2,16#7c,
      16#43,16#e9,16#34,16#00,16#8c,16#38,16#9c,16#0f,
      16#68,16#37,16#88,16#49,16#9a,16#7c,16#05,16#f6>>,
<<"Now is the time for all ">> ==
      crypto:des_cbc_decrypt(Key,IVec,C).
```

The following is true for the DES CBC mode. For all decompositions $P_1 \mathbin{++} P_2 = P$ of a plain text message P (where the length of all quantities are multiples of 8 bytes), the encryption C of P is equal to $C_1 \mathbin{++} C_2$, where C_1 is obtained by encrypting P_1 with Key and the initializing vector $IVec$, and where C_2 is obtained by encrypting P_2 with Key and the initializing vector $l(C_1)$, where $l(B)$ denotes the last 8 bytes of the binary B .

Similarly, for all decompositions $C_1 \mathbin{++} C_2 = C$ of a cipher text message C (where the length of all quantities are multiples of 8 bytes), the decryption P of C is equal to $P_1 \mathbin{++} P_2$, where P_1 is obtained by decrypting C_1 with Key and the initializing vector $IVec$, and where P_2 is obtained by decrypting C_2 with Key and the initializing vector $l(C_1)$, where $l(.)$ is as above.
