1 OTP_Mibs User's Guide

The OTP_Mibs application provides an SNMP management information base for Erlang nodes.

1.1 Introduction

1.1.1 Purpose
The purpose of the OTP_Mibs application is to provide an SNMP management information base for Erlang nodes.

1.1.2 Pre-requisites
It is assumed that the reader is familiar with the Erlang programming language, concepts of OTP and has a basic knowledge of SNMP.

1.2 Mibs

1.2.1 Structure
The OTP mibs are stored in the $OTP_ROOT/lib/otp_mibs/mibs/ directory. They are defined in SNMPv2 SMI syntax. An SNMPv1 version of the mib is delivered in the mibs/v1 directory. The compiled MIB is located under priv/mibs, and the generated .hrl file under the include directory. To compile a MIB that IMPORTS a MIB in the OTP_Mibs application, give the option \{il, ["otp_mibs/priv/mibs"]\} to the MIB compiler.

1.2.2 OTP-MIB
The OTP-MIB mib represents information about Erlang nodes such as node name, number of running processes, virtual machine version etc. If the MIB should be used in a system, it should be loaded into an SNMP agent by using the API function otp_mib:load/1.

1.2.3 OTP-REG
The OTP-REG mib defines the unique OTP subtree of object identifiers under the Ericsson subtree. Under the OTP subtree several object identifiers are defined. This module is typically included by OTP applications defining their own mibs, or ASN.1 modules in general, that require unique object identifiers under the OTP subtree.

1.2.4 OTP-TC
The OTP-TC mib provides the textual convention datatype OwnerString.
2 Reference Manual

The OTP_Mibs application provides an SNMP management information base for Erlang nodes.
The SNMP application should be used to start an SNMP agent. Then the API functions below can be used to load/unload the OTP-MIB into/from the agent. The instrumentation of the OTP-MIB uses Mnesia, hence Mnesia must be started prior to loading the OTP-MIB.

**Warning:**

This application has been deprecated and will be removed in a future release.

### Exports

**load(Agent)** -> ok | {error, Reason}

Types:

- Agent = pid() | atom()
- Reason = term()

Loads the OTP-MIB.

**unload(Agent)** -> ok | {error, Reason}

Types:

- Agent = pid() | atom()
- Reason = term()

Unloads the OTP-MIB.
